Be a Tourism Water Champion

7 Ways to Conserve Water

Potable water is a finite resource, primarily supplied from rainfall that replenishes both surface water and groundwater. Over the past decade, we have experienced reduced rainfall and increased demand from population growth, tourism, and agriculture. Continuing at this rate, risks a water crisis, threatening our ability to meet the needs of residents and sustain vital sectors like tourism.

Here are 7 steps to conserve water and ensure a sustainable future for tourism and our island:

1. Rainwater Harvesting

Channel your rainwater into rainwater harvesting systems. A good source of additional water storage capacity.

2. Efficient Irrigation

Use smart irrigation systems to minimise water wastage in landscaping and gardens.

3. Water Recycling

Treat and reuse wastewater for non-potable purposes such as irrigating landscapes. Thus reducing the demand on freshwater sources.

4. Water-Efficient Fixtures and Appliances

Install low-flow faucets, showerheads, and toilets to reduce water consumption. Use energy-efficient and water-saving appliances, like dishwashers and laundry machines.

5. Guest Education

Vividly display water conservation practices including reusing towels and linens, taking shorter showers, and turning off taps when not in use.

6. Water Audits

Monitor your water bill regularly for high water usage and implement targeted conservation measures - repairing leaks or optimising water use in kitchens and laundry facilities.
